- A summary of 9S12 hardware subsystems
- Introduction to the 9S12 Timer subsystem
 - The 9S12 has a 16-bit free-running counter to determine the time and event happens, and to make an event happen at a particular time
 - The counter is normally clocked with an 8 MHz clock
 - The Timer Overflow (TOF) bit -- when the timer rolls over from 0x0000 to 0xFFFF it sets a flip-flop to show that this has happened.
 - The Timer Prescaler (PR2:0) bits of Timer Interrupt Mask 2 (TMSK2) register: Allows you to change the frequency of the clock driving the 16-bit counter.

9S12 Built-In Hardware

• The 9S12 has a number of useful pieces of hardware built into the chip.

• Different versions of the 9S12 have slightly different pieces of hardware. Information about the hardware modules is found in data sheet for the modules.

• We are using the MC9S12DT256 chip (often referred to as the 9S12 chip).

• Here is some of the hardware available on the MC9S12DT256:

- General Purpose Input/Output (GPIO) Pins: These pins can be used to read the logic level on an 9S12 pin (input) or write a logic level to an HC12 pin (output). We have already seen examples of this – PORTA and PORTB. Each GPIO pin has an associated bit in a data direction register which you use to tell the 9S12 if you want to use the GPIO pin as input or output. (For example, DDRA is the data direction register for PORTA.)

- **Timer-Counter Pins**: The 9S12 is often used to time or count events. For example, to use the 9S12 in a speedometer circuit you need to determine the time it takes for a wheel to make one revolution.

To keep track of the number of people passing through a turnstile you need to count the number of times the turnstile is used.

To control the ignition system of an automobile you need to make a particular spark plug fire at a particular time. The 9S12 has hardware built in to do these tasks.

* For information, see the ECT 16B8C Block User Guide.

- Pulse Width Modulation (PWM) Pins: To make a motor turn at a particular speed you need to send it a pulse width modulated signal. This is a signal at a particular frequency (which differs for different motors), which is high for part of the period and low for the rest of the period. To have the motor turn slowly, the signal might be high for 10% of the time and low for 90% of the time. To have the motor turn fast, the signal might be high for 90% of the time and low for 10% of the time.

* For information, see the PWM 8B8C Block User Guide.

- Serial Interfaces: It is often convenient to talk to other digital devices (such as another computer) over a serial interface. When you connect your 9S12 to the PC in the lab, the HC12 talks to the PC over a serial interface. The 9S12 has two serial interfaces: an asynchronous serial interface (called the Serial Communications Interface, or SCI) and a synchronous serial interface (called the Serial Peripheral Interface, or SPI).

* For information on the SCI, see the 9S12 Serial Communications Interface (SCI) Block User Guide.

* For information on the SPI, see the SPI Block User Guide.

- Analog-to-Digital Converter (ADC): Sometimes it is useful to convert a voltage to a digital number for use by the 9S12. For example, a temperature sensor may put out a voltage proportional to the temperature. By converting the voltage to a digital number, you can use the 9S12 to determine the temperature.

* For information, see the ATD 10B8C Block User Guide.

• Most of the 9S12 pins serve dual purposes. For example, PORTT is used for the timer/counter functions. If you do not need to use PORTT for timer/counter functions, you can use the pins of PORTT for GPIO. There are registers which allow you to set up the PORTT pins to use as GPIO, or to use as timer/counter functions. (These are called the Timer Control Registers).

Introduction to the 9S12 Timer Subsystem

• The 9S12 has a 16-bit counter that normally runs with an 24 MHz clock.

• Complete information on the 9S12 timer subsystem can be found in the ECT 16B8C Block User Guide. ECT stands for Enhanced Capture Timer.

• When you reset the 9S12, the clock to the timer subsystem is initially turned off to save power.

- To turn on the clock you need to write a 1 to Bit 7 of register TSCR1 (Timer System Control Register 1) at address 0x0046.

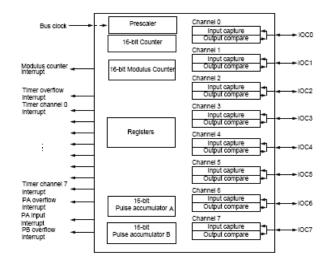

• The clock starts at 0x0000, counts up (0x0001, 0x0002, etc.) until it gets to 0xFFFF. It rolls over from 0xFFFF to 0x0000, and continues counting forever (until you turn the counter off or reset the 9S12).

• It takes 2.7307 ms (65,536 counts/24,000,000 counts/sec) for the counter to count from 0x0000 to 0xFFFF and roll over to 0x0000.

• To determine the time an event happens, you can read the value of the clock (by reading the 16-bit TCNT (Timer Count Register) at address 0x0044.

ECT_16B8C Block User Guide V01.03

1.4 Block Diagram

M MOTOROLA

Timer inside the 68HC12:

When you enable timer (by writing a 1 to bit 7 of TSCR), you connect an 24–MHz oscillator to a 16–bit counter.

You can read the counter at address TCNT.

The counter will start at 0, will count to 0xFFFF, then roll over to 0x0000. It will take 2.7307 ms for this to happen.

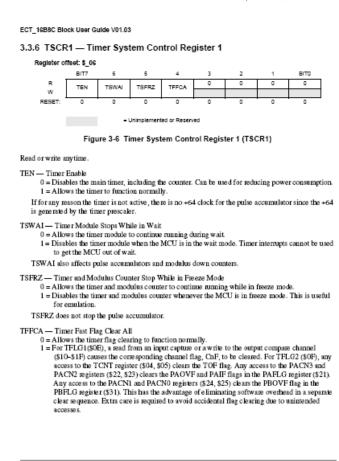

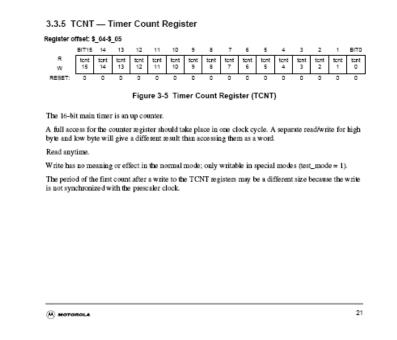

To enable timer on HC12, set Bit 7 of register TCSR:

22

bset TSCR1,#\$80

TSCR1 = TSCR1 | 0x80;

• To put in a delay of 2.7307 ms, you could wait from one reading of 0x0000 to the next reading of 0x0000.

• Problem: You cannot read the TCNT register quickly enough to make sure you will see the 0x0000.

To put in a delay for 2.7307 ms, could watch timer until

TCNT == 0x0000:

	bset	TSCR1,#\$80	TSCR1 = TSCR1 0x80;
11:	ldd	TCNT	while (TCNT != 0x0000);
	bne 11	l	

Problem: You might see 0xFFFF and 0x0001, and miss 0x0000

24 MHz	16-Bit Counter
TEN	TCNT (addr 0x44)
(Bit 7 of TSCR1, addr 0x46)	

• Solution: The 9S12 has built-in hardware with will set a flip-flop every time the counter rolls over from 0xFFFF to 0x0000.

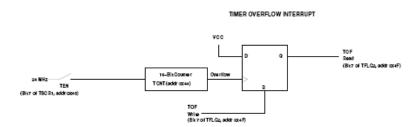

• To wait for 2.7307 ms, just wait until the flip-flop is set, then clear the flip-flop, and wait until the next time the flip-flop is set.

• You can find the state of the flip-flop by looking at bit 7 (the Timer Overflow Flag (TOF) bit) of the Timer Flag Register 2 (TFLG2) register at address 0x004F.

• You can clear the flip-flop by writing a 1 to the TOF bit of TFLG2.

Solution: When timer overflows, latch a 1 into a flip–flop. Now when timer overflows (goes from 0xFFFF to 0x0000), Bit 7 of TFLG2 register is set to one. Can clear register by writing a 1 to Bit 7 of TFLG register.

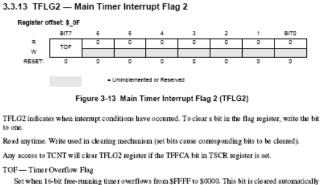

(Note: Bit 7 of TFLG2 for a read is different than Bit 7 of TFLG2 for a write)

bset TSCR1,#\$80 ; Enable timer 11: brclr TFLG2,#\$80,11 ; Wait until Bit 7 of TFLG2 is set Idaa #\$80 TSCR1 = TSCR1 | 0x80; //Enable timer while ((TFLG2 & 0x80) == 0) ; // Wait for TOF

•	program		. program		
•	staa TFGL2	; Clear TOF flag	TFLG2 = 0x80;	// Clear TOF	

Set when 16-bit free-running timer overflows from \$FFFF to \$0000. This bit is cleared automatically by a write to the TFLG2 register with bit 7 set. (See also TCRE control bit explanation.)

(M) MOTOROLA	27

• Another problem: Sometimes you may want to delay longer than 2.7307 ms, or time an event which takes longer than 2.7307 ms. This is hard to do if the counter rolls over every 2.7307 ms.

• Solution: The 9S12 allows you to slow down the clock which drives the counter.

• You can slow down the clock by dividing the 24 MHz clock by 2, 4, 8, 16, 32, 64 or 128.

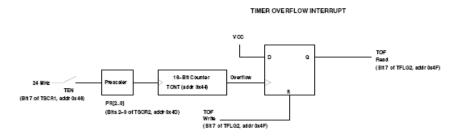

• You do this by writing to the prescaler bits (PR2:0) of the Timer System Control Register 2 (TSCR2) Register at address 0x004D.

2.7307 ms will be too short if you want to see lights flash. You can slow down clock by dividing it before you send it to the 16-bit counter. By setting prescaler bits PR2,PR1,PR0 of TSCR2 you can slow down the clock:

PR	Divide	Freq	Overflow Rate
000	1	24 MHz	2.7307 ms
001	2	12 MHz	5.4613 ms
010	4	6 MHz	10.9227 ms
011	8	3 MHz	21.8453 ms
100	16	1.5 MHz	43.6907 ms
101	32	0.75 MHz	87.3813 ms
110	64	0.375 MHz	174.7627 ms
111	128	0.1875 MHz	349.5253 ms

To set up timer so it will overflow every 87.3813 ms:

bset TSCR1,#\$80 staa TSCR2 TSCR1 = TSCR1 | 0x80; TSCR1 = TSCR1 | 0x80;TSCR2 = 0x05;

3.3.11 TSCR2 — Timer System Control Register 2

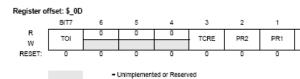

Figure 3-11 Timer System Control Register 2 (TSCR2)

Read or write anytime.

TOI - Timer Overflow Interrupt Enable

0 = Interrupt inhibited 1 = Hardware interrupt requested when TOF flag set

TCRE - Timer Counter Reset Enable

This bit allows the timer counter to be reset by a successful output compare 7 event. This mode of operation is similar to an up-counting modulus counter. 0 = Counter reset inhibited and counter free runs

1 = Counter reset by a successful output compare 7

If TC7 = \$0000 and TCRE = 1, TCNT will stay at \$0000 continuously. If TC7 = \$FFFF and TCRE =

1, TOF will never be set when TCNT is reset from \$FFFF to \$0000.

PR2, PR1, PR0 - Timer Prescaler Select

MOTOROLA

25

BITO

PRD

0

ECT_16B8C Block User Guide V01.03

These three bits specify the number of +2 stages that are to be inserted between the bus clock and the main timer counter.

Table 2.4 Processor Selection

Table 3-4 Prescaler Selection			
PR2	PR1	PR0	Prescale Factor
0	0	0	1
0	0	1	2
0	1	0	4
0	1	1	8
1	0	0	16
1	0	1	32
1	1	Ö	64
1	1	1	128

The newly selected prescale factor will not take effect until the next synchronized edge where all prescale counter stages equal zero.

Setting and Clearing Bits in C

• To put a specific number into a memory location or register (e.g., to put 0x55 into PORTA):

movb #\$55,PORTA PORTA = 0x55;

• To set a particular bit of a register (e.g., set Bit 4 of PORTA) while leaving the other bits unchanged do a bitwise OR of the register and a mask which has a 1 in the bit(s) you want to set, and a 0 in the other bits:

bset PORTA,#\$10 PORTA = PORTA | 0x10;

• To clear a particular bit of a register (e.g., clear Bit 5 of PORTA) while leaving the other bits unchanged do a bitwise AND of the register and a mask which has a 0 in the bit(s) you want to clear, and a 1 in the other bits. You can construct this mask by

complementing a mask which has a 1 in the bit(s) you want to set, and a 0 in the other bits:

bclr PORTA,#\$20 PORTA = PORTA & 0xDF; PORTA = PORTA & ~0x20;

• To change several bits of a register, AND the register with 1's in the bits you want to leave unchanged, then OR the result with 1's in the bits you want to set, and 0's in the bits you want to clear. For example, to set bits 2 and 0, and clear bit 1 (write 101 to bits 2-0) of TSCR2, do the following:

ldaa TSCR2	TSCR2 = (TSCR2 & 0xF8) 0x05;
anda 0xF8	
ora 0x05	
staa TSCR2
