## - MC9S12 Assembler Directives

- A Summary of MC9S12 Instructions
- Disassembly of MC9S12 op codes
- Review of Addressing Modes
- Which branch instruction to use (signed vs unsigned)
- Using X and Y registers as pointers
- Hand assembling a program
- How long does a program take to run?
o Assembler directives
- How to disassemble an MC9S12 instruction sequence

Summary of HCS12 addressing modes
ADDRESSING MODES

| Name |  | Example | Op Code | Effective <br> Address |
| :---: | :---: | :---: | :---: | :---: |
| INH | Inherent | ABA | 1806 | None |
| IMM | Immediate | LDAA \#\$35 | 8635 | $P C+1$ |
| DIR | Direct | LDAA \$35 | 9635 | 0x0035 |
| EXT | Extended | LDAA \$2035 | B6 2035 | 0x2035 |
| IDX <br> IDX1 <br> IDX2 | Indexed | LDAA 3, x <br> LDAA $30, \mathrm{x}$ <br> LDAA $300, \mathrm{X}$ | $\begin{array}{lllll} \text { A6 } & 03 & & \\ \text { A6 } & \text { E0 } & 13 & \\ \text { A6 } & \text { E2 } & 01 & \text { 2C } \end{array}$ | $\begin{aligned} & x+3 \\ & x+30 \\ & x+300 \end{aligned}$ |
| IDX | Indexed <br> Postincrement | LDAA 3, $\mathrm{X}+$ | A 632 | $\mathrm{X} \quad(\mathrm{X}+3 \rightarrow \mathrm{x})$ |
| IDX | Indexed Preincrement | LDAA 3, +X | A 6 22\| | $x+3 \quad(\mathrm{x}+3 \rightarrow \mathrm{x})$ |
| IDX | Indexed Postdecrement | LDAA 3, X - | A6 3D | $\mathrm{X} \quad(\mathrm{X}-3 \rightarrow \mathrm{x})$ |
| IDX | Indexed Predecrement | LDAA 3,-X | A6 2D | $\mathrm{x}-3 \quad(\mathrm{X}-3 \rightarrow \mathrm{x})$ |
| REL | Relative | BRA \$1050 <br> LBRA \$1F00 | $\begin{array}{ll} 20 & 23 \\ 18 & 20 \end{array} \quad \mathrm{EE} \quad \mathrm{CF}$ | $\begin{aligned} & P C+2+\text { Offset } \\ & P C+4+\text { Offset } \end{aligned}$ |

EE 308 Spring 2014

A few instructions have two effective addresses:

- MOVB \#\$AA,\$1C00 Move byte 0xAA (IMM) to address \$1C00 (EXT)
- MOVW 0,X,0,Y Move word from address pointed to by X (IDX) to address pointed to by Y (IDX)

A few instructions have three effective addresses:

- BRSET FOO,\#\$03,LABEL Branch to LABEL (REL) if bits \#\$03 (IMM) of variable FOO (EXT) are set.

## Using $X$ and $Y$ as Pointers

- Registers X and Y are often used to point to data.
- To initialize pointer use

## ldx \#table <br> not

## ldx table

- For example, the following loads the address of table (\$1000) into X; i.e., X will point to table:
ldx \#table ; Address of table $\Rightarrow X$
The following puts the first two bytes of table (\$0C7A) into X. X will not point to table:

Idx table ; First two bytes of table $\Rightarrow X$

- To step through table, need to increment pointer after use

ldaa 0,x

inx
or

[^0]EE 308 Spring 2014

Which branch instruction should you use?
Branch if A > B
Is $0 \mathrm{xFF}>0 \mathrm{x} 00$ ?
If unsigned, $0 \times \mathrm{xFF}=255$ and $0 \times 00=0$, so $0 \mathrm{xFF}>0 \mathrm{x} 00$

If signed, $0 x F F=-1$ and $0 x 00=0$, so $0 \mathrm{xFF}<0 \mathrm{x} 00$

Using unsigned numbers: BHI (checks C bit of CCR)
Using signed numbers: BGT (checks V bit of CCR)
For unsigned numbers, use branch instructions which check C bit
For signed numbers, use branch instructions which check V bit

## Hand Assembling a Program

To hand-assemble a program, do the following:

1. Start with the org statement, which shows where the first byte of the program will go into memory. (e.g., org \$2000 will put the first instruction at address \$2000.)
2. Look at the first instruction. Determine the addressing mode used.
(e.g., ldab \#10 uses IMM mode.)
3. Look up the instruction in the MC9S12 S12CPUV2 Reference Manual, find the appropriate Addressing Mode, and the Object Code for that addressing mode. (e.g., ldab IMM has object code C6 ii.)

- Table A. 1 of the S12CPUV2 Reference Manual has a concise summary of the instructions, addressing modes, op-codes, and cycles.

4. Put in the object code for the instruction, and put in the appropriate operand. Be careful to convert decimal operands to hex operands if necessary. (e.g., ldab \#10 becomes C6 0A.)
5. Add the number of bytes of this instruction to the address of the instruction to determine the address of the next instruction. (e.g., \$2000 + $\mathbf{2}$ = \$2002 will be the starting address of the next instruction.)

# org \$2000 ldab \#10 <br> loop: clra dbne b,loop swi

## DBNE

Operation (counter) $-1 \Rightarrow$ counter
If (counter) not $=0$, then $(\mathrm{PC})+\$ 0003+\mathrm{rel} \Rightarrow \mathrm{PC}$
Subtracts one from the counter register A, B, D, X, Y, or SP. Branches to a relative destination if the counter register does not reach zero. Rel is a 9-bit two's complement offset for branching forward or backward in memory. Branching range is $\$ 100$ to $\$ 0 \mathrm{FF}$ $(-256$ to +255$)$ from the address following the last byte of object code in the instruction.

EE 308 Spring 2014

## MC9S12 Cycles

- MC9S12 works on 48 MHz clock
- A processor cycle takes 2 clock cycles - P clock is 24 MHz
- Each processor cycle takes 41.7 ns ( $1 / 24 \mu \mathrm{~s}$ ) to execute
- An instruction takes from $\mathbf{1}$ to $\mathbf{1 2}$ processor cycles to execute
- You can determine how many cycles an instruction takes by looking up the CPU cycles for that instruction in the Reference Manual.
- For example, LDAB using the IMM addressing mode shows one CPU cycle (of type P).
- LDAB using the EXT addressing mode shows three CPU cycles (of type rPO).
- Section 6.6 of the S12CPUV2 Reference Manual explains what the HCS12 is doing during each of the different types of CPU cycles.

2000
2000 C6 0A
200287
20030431 FC
2006 3F
org \$2000; Inst Mode Cycles
ldab \#10 ; LDAB (IMM) 1 loop:clra ; CLRA (INH) 1
dbne b,loop ; DBNE (REL) 3
swi ; SWI 9

The program executes the ldab \#10 instruction once. It then goes through the loop 10 times (which has two instructions, one with one cycle and one with three cycles), and finishes with the swi instruction (which takes 9 cycles).

Total number of cycles:
$1+10 \times(1+3)+9=50$
50 cycles $=50 \times 41.7 \mathrm{~ns} /$ cycle $=2.08 \mu \mathrm{~s}$

## LDAB

(M) $\Rightarrow B$
or
$\mathrm{imm} \Rightarrow B$
Loads B with either the value in M or an immediate value.

## CCR

## Assembler Directives

- In order to write an assembly language program it is necessary to use assembler directives.
- T hese are not instructions which the HC12 executes but are directives to the assembler program about such things as where to put code and data into memory.
- CodeWarrior has a large number of assembler directives, which can be found in the CodeWarrior help section.
- We will use only a few of these directives. (Note: In the following table, [ ] means an optional argument.) Here are the ones we will need:

EE 308 Spring 2014

| Directive <br> Name | Description | Example |
| :---: | :--- | :--- |
| equ | Give a value to a symbol | len: equ 100 |
| org | Set starting value of location <br> counter where code or data <br> will go | \$1000 |
| dc.b | Allocate and initialize storage <br> for 8-bit variables. <br> Place the bytes in successive <br> memory locations | var: dc.b 2,18 <br> name: dc.b "Jane" |
| dc.w | Allocate and initialize storage <br> for 16-bit variables. <br> Place the bytes in successive <br> memory locations | var: dc.w \$ABCD |
| ds.b | Allocate specified number of <br> 8-bit storage places | Table: ds.b 10 |
| ds.w | Allocate specified number of <br> 16-bit storage spaces | table: ds.w 50 |
| dcb.b | Fill memory with a given <br> value: <br> The first value is the number <br> of bytes to fill. <br> The second number is the <br> value to put into memory | init_data: dc.b 100,0 |

New Mexico Institute of Mining and Technology
EE 308 Spring 2014

## Using labels in assembly programs

A label is defined by a name followed by a colon as the first thing on a line. When the label is referred to in the program, it has the numerical value of the location counter when the label was defined.

Here is a code fragment using labels and the assembler directives dc and ds:

| org | \$2000 |
| :---: | :---: |
| table1: dc.b | \$23,\$17,\$2,\$a3,\$56 |
| table2: ds.b | 5 |
| var: dc.w | \$43af |

The CodeWarrior assembler produces a listing file (.lst). Here is the listing file from the assembler:

Freescale HC12-Assembler
(c) Copyright Freescale 1987-2009

Abs. Rel. Loc Obj. code Source line
---- ---- ------ --------- ------------------------------

| 1 | 1 |  | org | \$2000 |
| :---: | :---: | :---: | :---: | :---: |
| 2 | $\begin{aligned} & 2 \text { a002000 } 2317 \text { F2A3 } \\ & 00200456 \end{aligned}$ | table1: | dc.b | \$23,\$17,\$f2,\$a3,\$56 |
| 3 | 3 a 002005 | table2: | ds.b | 5 |
| 4 | 4 a00200A 43AF | var: | dc.w | \$43af |
| 5 | 5 |  |  |  |

Note that table1 is a name with the value of $\$ 2000$, the value of the location counter defined in the org directive. Five bytes of data are defined by the dc.b directive, so the location counter is increased from \$2000 to \$2005.

Note that table2 is a name with the value of $\$ 2005$. Five bytes of data are set aside for table2 by the ds.b 5 directive. The as12 assembler initialized these five bytes of data to all zeros. var is a name with the value of \$200a, the first location after table2.

EE 308 Spring 2014

## HC12 Instructions

1. Data Transfer and Manipulation Instructions - instructions which move and manipulate data (S12CPUV2 Reference Manual, Sections 5.3, 5.4, and 5.5).

- Load and Store - load copy of memory contents into a register; store copy of register contents into memory.

LDAA \$2000 ; Copy contents of addr \$2000 into A
STD $0, \mathrm{X} \quad$; Copy contents of D to addrs X and $\mathrm{X}+1$

- Transfer - copy contents of one register to another.

TBA ; Copy B to A
TFR X,Y ; Copy X to Y

- Exhange - exchange contents of two registers.

XGDX ; Exchange contents of D and X
EXG A,B ; Exchange contents of A and B

- Move - copy contents of one memory location to another.

MOVB \$2000,\$20A0 ; Copy byte at \$2000 to \$20A0
MOVW 2,X+,2,Y+ ; Copy two bytes from address held ; in X to address held in Y ; Add 2 to X and Y
2. Arithmetic Instructions - addition, subtraction, multiplication, division (S12CPUV2 Reference Manual, Sections 5.6, 5.8 and 5.12).

ABA ; Add B to A; results in A
SUBD \$20A1 ; Subtract contents of \$20A1 from D
INX ; Increment X by 1
MUL ; Multiply A by B; results in D
3. Logic and Bit Instructions - perform logical operations (S12CPUV2 Reference Manual, Sections 5.9, 5.10, 5.11, 5.13 and 5.14).

- Logic Instructions

ANDA \$2000 ; Logical AND of A with contents of ; \$2000
EORB 2,X ; Exclusive OR B with contents of ; address (X+2)

- Clear, Complement and Negate Instructions

NEG -2,X ; Negate (2's comp) contents of ; address (X-2)
CLRA ; Clear ACC A

- Bit manipulate and test instructions - work with bits of a register or memory.

BITA \#\$08 ; Check to see if Bit 3 of A is set
BSET \$0002,\#\$18 ; Set bits 3 and 4 of address \$0002

- Shift and rotate instructions

LSLA ; Logical shift left A
ASR \$1000 ; Arithmetic shift right value at address
; \$1000

EE 308 Spring 2014
4. Compare and test instructions - test contents of a register or memory (to see if zero, negative, etc.), or compare contents of a register to memory (to see if bigger than, etc.) (S12CPUV2
Reference Manual, Section 5.9).

| TSTA | $;(\mathrm{A})-0$-- set flags accordingly |
| :--- | :--- |
| CPX \#\$8000 | $;(\mathrm{X})-\$ 8000$-- set flags accordingly |

5. Jump and Branch Instructions - Change flow of program (e.g., goto, it-then-else, switch-case) (S12CPUV2 Reference Manual, Sections 5.19, 5.20 and 5.21).

JMP L1 ; Start executing code at address label ; L1
BEQ L2 ; If Z bit set, go to label L2
DBNE X,L3 ; Decrement X; if X not 0 then goto L3
BRCLR $\$ 1 \mathrm{~A}, \#$ \$80,L4 ; If bit 7 of addr \$1A clear, go to
; label L4
JSR sub1 ; Jump to subroutine sub1
RTS ; Return from subroutine
6. Interrupt Instructions - Initiate or terminate an interrupt call (S12CPUV2 Reference Manual, Section 5.22).

- Interrupt instructions

SWI ; Initiate software interrupt
RTI ; Return from interrupt

New Mexico Institute of Mining and Technology
EE 308 Spring 2014
7. Index Manipulation Instructions - Put address into X, Y or SP, manipulate X, Y or SP (S12CPUV2 Reference Manual, Section 5.23).

$$
\begin{array}{ll}
\text { ABX } & \text {; Add }(\mathrm{B}) \text { to }(\mathrm{X}) \\
\text { LEAX } 5, \mathrm{Y} & ; \text { Put address }(\mathrm{Y})+5 \text { into } X
\end{array}
$$

8. Condition Code Instructions - change bits in Condition Code Register (S12CPUV2 Reference Manual, Section 5.26).
```
ANDCC #$f0 ; Clear N, Z, C and V bits of CCR
SEV ; Set V bit of CCR
```

9. Stacking Instructions - push data onto and pull data off of stack (S12CPUV2 Reference Manual, Section 5.24).

PSHA ; Push contents of A onto stack PULX ; Pull two top bytes of stack, put into X
10. Stop and Wait Instructions - put MC9S12 into low power mode (S12CPUV2 Reference Manual, Section 5.27).

| STOP | ; Put into lowest power mode |
| :--- | :--- |
| WAI | ; Put into low power mode until next interrupt |

11. Null Instructions
NOP ; No operation
12. Instructions we won't discuss or use - BCD arithmetic, fuzzy logic, minimum and maximum, multiply-accumulate, table interpolation (S12CPUV2 Reference Manual, Sections 5.7, 5.16, 5.17, and 5.18).

## Disassembly of an HC12 Program

- It is sometimes useful to be able to convert HC12 op codes into mnemonics.

## For example, consider the hex code:

## ADDR DATA

1000 C6 05 CE 2000 E6 0118060435 EE 3F

- To determine the instructions, use Table A-2 of the HCS12 Core Users Guide.
- If the first byte of the instruction is anything other than \$18, use Sheet 1 of Table A.2. From this table, determine the number of bytes of the instruction and the addressing mode. For example, \$C6 is a two-byte instruction, the mnemonic is LDAB, and it uses the IMM addressing mode. Thus, the two bytes C6 05 is the op code for the instruction LDAB \#\$05.
- If the first byte is $\mathbf{\$ 1 8}$, use Sheet 2 of Table A.2, and do the same thing. For example, $\mathbf{1 8} \mathbf{0 6}$ is a two byte instruction, the mnemonic is ABA, and it uses the INH addressing mode, so there is no operand. Thus, the two bytes $\mathbf{1 8 0 6}$ is the op code for the instruction $\mathbf{A B A}$.
- Indexed addressing mode is fairly complicated to disassemble. You need to use Table A. 3 to determine the operand. For example, the op code \$E6 indicates LDAB indexed, and may use two to four bytes (one to three bytes in addition to the op code). The postbyte $\mathbf{0 1}$ indicates that the operand is 0,1 , which is 5 -bit constant offset, which takes only one additional byte. All 5-bit constant offset, pre and post increment and decrement, and register offset instructions use one additional byte. All 9-bit constant offset instructions use two additional bytes, with the second byte holding 8 bits of the 9 bit offset. (The 9th bit is a direction bit, which is held in the first postbyte.) All 16-bit constant offset instructions use three postbytes, with the 2nd and 3rd holding the 16 -bit unsigned offset.
- Transfer (TFR) and exchange (EXG) instructions all have the op code $\$ \mathbf{B 7}$. Use Table A. 5 to determine whether it is TFR or an EXG, and to determine which registers are being used. If the most significant bit of the postbyte is $\mathbf{0}$, the instruction is a transfer instruction.
- Loop instructions (Decrement and Branch, Increment and Branch, and Test and Branch) all have the op code \$04. To determine which instruction the op code $\mathbf{\$ 0 4}$ implies, and whether the branch is positive (forward) or negative (backward), use Table A.6. For example, in the sequence $\mathbf{0 4}$ 35 EE, the 04 indicates a loop instruction. The 35 indicates it is a DBNE $\mathbf{X}$ instruction (decrement register X and branch if result is not equal to zero), and the direction is backward (negative). The EE indicates a branch of -18 bytes.
- Use up all the bytes for one instruction, then go on to the next instruction.

C6 $05 \quad \Rightarrow$ LDAB \#\$05 $\quad$| two-byte LDAB, IMM |
| :--- |
| addressing mode |

CE $2000 \Rightarrow$ LDX \#\$2000 | three-byte LDX, IMM |
| :---: |
| addressing mode |

E6 $01 \Rightarrow$ LDAB 1,X two to four-byte LDAB, IDX addressing mode. Operand $01=>1, \mathrm{X}$, a 5b constant offset which uses only one postbyte
$1806 \quad \Rightarrow$ ABA two-byte ABA, INH addressing mode
0435 EE $\Rightarrow$ DBNE X,(-18) three-byte loop instruction Postbyte 35 indicates DBNE X, negative
3F $\quad \Rightarrow$ SWI one-byte SWI, INH addressing mode

EE 308 Spring 2014

* The opcode $\$ 04$ (on sheet 1 of 2 ) corresponds to one of the loop primitive instructions DBEQ, DBNE, IBEQ, IBNE, TBEQ, or TBNE. $\dagger$ Refer to instruction summary for more information.
$\ddagger$ Refer to instruction summary for different HC12 cycle count.
Page 2: When the CPU encounters a page 2 opcode ( $\$ 18$ on page 1 of the opcode map), it treats the next byte of object code as a page 2 instruction opcode.
