

- Disassembly of MC9S12 op codes
- Decimal, Hexadecimal and Binary Numbers
 - o How to disassemble an MC9S12 instruction sequence
 - Binary numbers are a code and represent what the programmer intends for the code
 - Convert binary and hex numbers to unsigned decimal
 - Convert unsigned decimal to hex
 - o Signed number representation − 2's complement form
 - Using the 1's complement table to find 2's complements of hex numbers
 - Overflow and Carry
 - Addition and subtraction of binary and hex numbers
 - o The condition code register (CCR): N, Z, V and C bits

HC12 Instructions

- 1. Data Transfer and Manipulation Instructions instructions which move and manipulate data (S12CPUV2 Reference Manual, Sections 5.3, 5.4, and 5.5).
- Load and Store load copy of memory contents into a register; store copy of register contents into memory.

LDAA \$2000 ; Copy contents of addr \$2000 into A STD 0,X ; Copy contents of D to addrs X and X+1

• Transfer — copy contents of one register to another.

TBA ; Copy B to A

TFR X,Y; Copy X to Y

• Exhange — exchange contents of two registers.

XGDX ; Exchange contents of D and X EXG A,B ; Exchange contents of A and B

• Move — copy contents of one memory location to another.

MOVB \$2000,\$20A0 ; Copy byte at \$2000 to \$20A0

MOVW 2,X+,2,Y+ ; Copy two bytes from address held
; in X to address held in Y
; Add 2 to X and Y

2. Arithmetic Instructions — addition, subtraction, multiplication, divison (**S12CPUV2 Reference Manual**, Sections 5.6, 5.8 and 5.12).

ABA ; Add B to A; results in A

SUBD \$20A1 ; Subtract contents of \$20A1 from D

INX ; Increment X by 1

MUL ; Multiply A by B; results in D

- 3. Logic and Bit Instructions perform logical operations (**S12CPUV2 Reference Manual**, Sections 5.9, 5.10, 5.11, 5.13 and 5.14).
 - Logic Instructions

ANDA \$2000 ; Logical AND of A with contents of ;

\$2000

EORB 2,X ; Exclusive OR B with contents of ;

address (X+2)

Clear, Complement and Negate Instructions

NEG -2,X; Negate (2's comp) contents of; address

; (X-2)

CLRA ; Clear Acc A

• Bit manipulate and test instructions — work with one bit of a register or memory.

BITA #\$08 ; Check to see if Bit 3 of A is set BSET \$0002,#\$18 ; Set bits 3 and 4 of address \$002

Shift and rotate instructions

LSLA ; Logical shift left A

ASR \$1000 ; Arithmetic shift right value at address

\$1000

4. Compare and test instructions — test contents of a register or memory (to see if zero, negative, etc.), or compare contents of a register to memory (to see if bigger than, etc.) (**S12CPUV2 Reference Manual**, Section 5.9).

TSTA ; (A)-0 -- set flags accordingly

CPX #\$8000 ; (X) - \$8000 -- set flags accordingly

5. Jump and Branch Instructions — Change flow of program (e.g., goto, it-then-else, switch-case) (**S12CPUV2 Reference Manual**, Sections 5.19, 5.20 and 5.21).

JMP L1 ; Start executing code at address label

; L1

BEQ L2 ; If Z bit set, go to label L2

DBNE X,L3 ; Decrement X; if X not 0 then

; goto L3

BRCLR \$1A,#\$80,L4 ; If bit 7 of addr \$1A clear, go to

; label L4

- 6. Interrupt Instructions Initiate or terminate an interrupt call (**S12CPUV2 Reference Manual**, Section 5.22).
- Interrupt instructions

SWI; Initiate software interrupt RTI; Return from interrupt

7. Index Manipulation Instructions — Put address into X, Y or SP, manipulate X, Y or SP (**S12CPUV2 Reference Manual**, Section 5.23).

ABX ; Add (B) to (X)

LEAX 5,Y ; Put address (Y) + 5 into X

8. Condition Code Instructions — change bits in Condition Code Register (**S12CPUV2 Reference Manual**, Section 5.26).

ANDCC #\$f0 ; Clear N, Z, C and V bits of CCR

SEV ; Set V bit of CCR

9. Stacking Instructions — push data onto and pull data off of stack (**S12CPUV2 Reference Manual**, Section 5.24).

PSHA ; Push contents of A onto stack

PULX ; Pull two top bytes of stack, put into X

10. Stop and Wait Instructions — put MC9S12 into low power mode (S12CPUV2 Reference Manual, Section 5.27).

STOP ; Put into lowest power mode

WAI ; Put into low power mode until next interrupt

11. Null Instructions

NOP; No operation

BRN ; Branch never

12. Instructions we won't discuss or use — BCD arithmetic, fuzzy logic, minimum and maximum, multiply-accumulate, table interpolation (**S12CPUV2 Reference Manual**, Sections 5.7, 5.16, 5.17, and 5.18).

Disassembly of an HC12 Program

• It is sometimes useful to be able to convert *HC12 op codes* into *mnemonics*.

For example, consider the hex code:

ADDR DATA						
1000 C6 05 CE	20 00 E6	01 18	06 04	35 E	 ЕЕ	3E

- To determine the instructions, use Table A-2 of the HCS12 Core Users Guide.
 - If the first byte of the instruction is anything other than \$18, use Sheet 1 of Table A.2. From this table, determine the number of bytes of the instruction and the addressing mode. For example, \$C6 is a two-byte instruction, the mnemonic is **LDAB**, and it uses the **IMM** addressing mode. Thus, the two bytes **C6 05** is the op code for the instruction **LDAB** #\$05.
 - If the first byte is **\$18**, use Sheet 2 of Table A.2, and do the same thing. For example, **18 06** is a two byte instruction, the mnemonic is **ABA**, and it uses the **INH** addressing mode, so there is no operand. Thus, the two bytes **18 06** is the op code for the instruction **ABA**.
 - Indexed addressing mode is fairly complicated to disassemble. You need to use Table A.3 to determine the operand. For example, the op code \$E6 indicates LDAB indexed, and may use two to four bytes (one to three bytes in addition to the op code). The postbyte 01 indicates that the

operand is 0,1, which is **5-bit constant offset**, which takes only one additional byte. All 5-bit constant offset, pre and post increment and decrement, and register offset instructions use one additional byte. All **9-bit constant offset** instructions use two additional bytes, with the second byte holding 8 bits of the 9 bit offset. (**The 9th bit is a direction bit**, which is held in the first postbyte.) All 16-bit constant offset instructions use three postbytes, with the 2nd and 3rd holding the 16-bit unsigned offset.

- Transfer (**TFR**) and exchange (**EXG**) instructions all have the op code **\$B7**. Use Table A.5 to determine whether it is **TFR** or an **EXG**, and to determine which registers are being used. If the most significant bit of the postbyte is **0**, the instruction is a transfer instruction.
- Loop instructions (Decrement and Branch, Increment and Branch, and Test and Branch) all have the op code **\$04**. To determine which instruction the op code **\$04** implies, and whether the branch is <u>positive</u> (forward) or <u>negative</u> (backward), use Table A.6. For example, in the sequence **04 35 EE**, the 04 indicates a loop

instruction. The 35 indicates it is a **DBNE X** instruction (decrement register X and branch if result is not equal to zero), and the direction is backward (negative). The **EE** indicates a branch of -18 bytes.

• Use up all the bytes for one instruction, then go on to the next instruction

C6 05	⇒ LDAA #\$05	two-byte LDAA, IMM
		addressing mode
CE 20 00	⇒ LDX #\$200	0 three-byte LDX, IMM
		addressing mode
E6 01	\Rightarrow LDAB 1,X	two to four-byte LDAB,
		IDX addressing mode. Operand
		$01 \Rightarrow 1,X$, a 5b constant offset
		which uses only one postbyte
18 06	\Rightarrow ABA	two-byte ABA, INH addressing
		mode
04 35 EE	\Rightarrow DBNE X,(-1	three-byte loop instruction
		Postbyte 35 indicates DBNE X,
		negative
3F	⇒ SWI	one-byte SWI, INH addressing
		mode

^{*} The opcode \$04 (on sheet 1 of 2) corresponds to one of the loop primitive instructions DBEQ, DBNE, IBEQ, IBNE, TBEQ, or TBNE.

Page 2: When the CPU encounters a page 2 opcode (\$18 on page 1 of the opcode map), it treats the next byte of object code as a page 2 instruction opcode.

[†] Refer to instruction summary for more information.

[‡] Refer to instruction summary for different HC12 cycle count.

For 16-bit offset long branches precede opcode with a \$18 page prebyte.

Binary, Hex and Decimal Numbers (4-bit representation)

Binary	Hex	Decimal
0000	0	0
0001	1	1
0010	2	2
0011	3	3
0100	4	4
0101	5	5
0110	6	6
0111	7	7
1000	8	8
1001	9	9
1010	Α	10
1011	В	11
1100	С	12
1101	D	13
1110	E	14
1111	F	15

What does a number represent?

Binary numbers are a code, and represent what the programmer intends for the code.

0x72 Some possible meanings:

'r' (ASCII)

INC MEM (hh ll) (HC12 instruction)

114₁₀ (Unsigned number)

+114₁₀ (Signed number)

Set temperature in room to 69 °F

Set cruise control speed to 120 mph

Binary to Unsigned Decimal:

Convert Binary to Unsigned Decimal 1111011 $_2$ 1 x 2 6 + 1 x 2 5 + 1 x 2 4 + 1 x 2 3 + 0 x 2 2 + 1 x 2 1 + 1 x 2 0 1 x 64 + 1 x 32 + 1 x 16 + 1 x 8 + 0 x 4 + 1 x 2 + 1 x 1 123 $_{10}$

Hex to Unsigned Decimal

Convert Hex to Unsigned Decimal 82D6 ₁₆ 8 x 16³ + 2 x 16² + 13 x 16¹ + 6 x 16⁰ 8 x 4096 + 2 x 256 + 13 x 16 + 6 x 1 33494 ₁₀

Unsigned Decimal to Hex

Convert Unsigned Decimal to Hex

Division	Q	R			
	_	Decimal	Hex		
721/16	45	1	1 🛉		
45/16	2	13	D		
2/16	0	2	2		

$$721_{10} = 2D1_{16}$$

Signed Number Representation in 2's Complement Form:

If the most significant bit (MSB) is 0 (most significant hex digit 0-7), then the number is positive.

Get decimal equivalent by converting number to decimal, and use the + sign.

Example for 8-bit number:

$$3A_{16} \rightarrow + (3 \times 16^{1} + 10 \times 16^{0})_{10} + (3 \times 16 + 10 \times 1)_{10} + 58_{10}$$

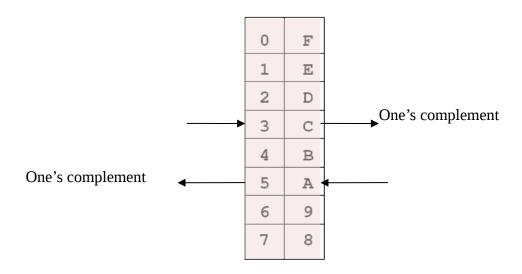

If the most significant bit is 1 (most significant hex digit 8–F), then the number is negative.

Get decimal equivalent by taking 2's complement of number, converting to decimal, and using – sign.

Example for 8-bit number:

One's complement table makes it simple to finding 2's complements

To take two's complement, add one to one's complement.

Take two's complement of **D0C3**:

$$2F3C + 1 = 2F3D$$

Addition and Subtraction of Binary and Hexadecimal Numbers

Setting the C (Carry), V (Overflow), N (Negative) and Z (Zero) bits

How the C, V, N and Z bits of the CCR are changed?

N bit is set if result of operation is negative (MSB = 1)

Z bit is set if result of operation is zero (All bits = 0)

V bit is set if operation produced an overflow

C bit is set if operation produced a carry (borrow on subtraction)

Note: Not all instructions change these bits of the CCR

Addition of Hexadecimal Numbers

ADDITION:

C bit set when result does not fit in word

V bit set when
$$P + P = N$$
 or $N + N = P$

N bit set when MSB of result is 1

Z bit set when result is 0

7A +52	2A +52	AC +8A	AC +72
CC	7C	36	 1E
C: 0	C: 0	C: 1	C: 1
V: 1	V: 0	V: 1	V: 0
N: 1	N: 0	N: 0	N: 0
Z: 0	Z: 0	Z: 0	Z: 0

Subtraction of Hexadecimal Numbers

SUBTRACTION:

C bit set on borrow (when the magnitude of the subtrahend is greater than the minuend

V bit set when N - P = P or
$$P - N = N$$

N bit set when MSB is 1

Z bit set when result is 0

7A -5C	8A -5C	5C -8A	2C -72
1E	 2E	D2	BA
C: 0	C: 0	C: 1	C: 1
V: 0	V: 1	V: 1	V: 0
N: 0	N: 0	N: 1	N: 1
Z: 0	Z: 0	Z: 0	Z: 0
