# Pointers in C

To read a byte from memory location OxE000:

var = \*(char \*) 0xE000;

To write a 16-bit word to memory location 0xE002:

\*(int \*) 0xE002 = var;

Program to count the number of negative numbers in an array in memory

```
/* Program to count the number of negative numbers in memory
                                                                 *
 * Start at 0xE000, go through 0xEFFF
                                                                 *
 * Treat the numbers as 8-bit
                                                                 *
 */
                        /* common defines and macros */
#include <hidef.h>
                             /* derivative-specific definitions */
#include "derivative.h"
unsigned short num_neg;/* Make num_neg global so we can find it in memory */
                       /* Use type int so can hold value larger than 256
                                                                            */
                       /* Unsigned because number cannot be negative
                                                                            */
main()
ſ
    char *ptr,*start,*end;
    start = (char *) 0xE000; /* Address of first element */
    end = (char *) 0xEFFF;
                              /* Address of last element */
    num_neg = 0;
    for (ptr = start; ptr <= end; ptr = ptr+1) {</pre>
        if (*ptr < 0) num_neg = num_neg + 1;</pre>
    }
    __asm(swi);
                               /* Exit to DBug-12 */
}
```

# Hello, World!

• Here is the standard "hello, world" program:

```
#include <stdio.h>
main()
{
    printf("hello, worl!d\r\n");
}
```

- To write the "hello, world" program, you need to use the printf() function.
- The printf() function is normally a library function
- In CodeWarrior, you can access printf() by doing the following:
  - 1. In your C program, add the following lines:

#include <stdio.h>
#include <termio.h>

2. In CodeWarrior, select Project, Add Files, and select the file termio.c. This is in the CodeWarrior library, which is in the following location on my computer:

```
c:\Program Files\Freescale\CWS12v5.1\lib\hc12c\src
```

Your C program will look like this:

```
#include <stdio.h>
#include <termio.h>
main()
{
    printf("hello, world!\r\n");
    __asm(swi);
}
```

- The above program is about 1,500 bytes long.
- To load the program into your Dragon12 board, you will have to edit the .s19 file and remove the first line which starts with a S0. The last line of the .s19 file looks this:

# S105FFFE2029B4

This tells the loader to put the 16-bit number 2029 into address FFFE. The address FFFE is in flash EEPROM, and the loader will not be able to write there. You can leave the line in, in which case DBug12 will give you the warning "Can't Write Target Memory", or yo can remove this line from the .s19 file to avoid getting the warning. (If you could put 2029 into address FFFE, your MC9S12 would start executing the code at address 0x2029 when you reset the board.)

• You can print out variables as well. Here is an example:

```
#include <stdio.h>
#include <termio.h>
main()
{
    int i;
    for (i=0;i<100;i++) printf("i = %d\r\n",i);
    __asm(swi);
}</pre>
```

# MC9S12 Built-In Hardware

- The MC9S12 has lots of useful pieces of hardware built into the chip.
- Different versions of the MC9S12 have different pieces of hardware. Information about the hardware modules is found in data sheet for the modules.
- We are using the MCMC9S12DP256 chip.
- Here is some of the hardware available on the MCMC9S12DP256:
  - General Purpose Input/Output (GPIO) Pins: These pins can be used to read the logic level on an MC9S12 pin (input) or write a logic level to an MC9S12 pin (output). We have already seen examples of this – PORTA and PORTB. Each GPIO pin has an associated bit in a data direction register which you use to tell the MC9S12 if you want to use the GPIO pin as input or output. (For example, DDRA is the data direction register for PORTA.)
  - Timer-Counter Pins: The MC9S12 is often used to time or count events. For example, to use the MC9S12 in a speedometer circuit you need to determine the time it takes for a wheel to make one revolution. To keep track of the number of people passing through a turnstile you need to count the number of times the turnstile is used. To control the ignition system of an automobile you need to make a particular spark plug fire at a particular time. The MC9S12 has hardware built in to do these tasks.
    - \* For information, see the ECT\_16B8C Block User Guide.
  - Pulse Width Modulation (PWM) Pins: To make a motor turn at a particular speed you need to send it a pulse width modulated signal. This is a signal at a particular frequency (which differs for different motors), which is high for part of the period and low for the rest of the period. To have the motor turn slowly, the signal might be high for 10% of the time and low for 90% of the time. To have the motor turn fast, the signal might be high for 90% of the time and low for 10% of the time.
    - \* For information, see the PWM\_8B8C Block User Guide.

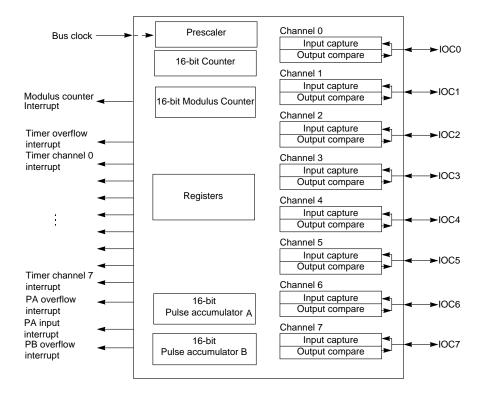

- Serial Interfaces: It is often convenient to talk to other digital devices (such as another computer) over a serial interface. When you connect your MC9S12 to the PC in the lab, the MC9S12 talks to the PC over a serial interface. The MC9S12 has two serial interfaces: an asynchronous serial interface (called the Serial Communications Interface, or SCI) and a synchronous serial interface (called the Serial Peripheral Interface, or SPI).
  - \* For information on the SCI, see the MC9S12 Serial Communications Interface (SCI) Block User Guide.
  - \* For information on the SPI, see the **SPI Block User Guide**.
- Analog-to-Digital Converter (ADC): Sometimes it is useful to convert a voltage to a digital number for use by the MC9S12. For example, a temperature sensor may put out a voltage proportional to the temperature. By converting the voltage to a digital number, you can use the MC9S12 to determine the temperature.
  - \* For information, see the ATD\_10B8C Block User Guide.
- Most of the MC9S12 pins serve dual purposes. For example, PORTT is used for the timer/counter functions. If you do not need to use PORTT for timer/counter functions, you can use the pins of PORTT for GPIO. There are registers which allow you to set up the PORTT pins to use as GPIO, or to use as timer/counter functions. (These are called the Timer Control Registers).

# Introduction to the MC9S12 Timer Subsystem

- The MC9S12 has a 16-bit counter that normally runs with an 24 MHz clock.
- Complete information on the MC9S12 timer subsystem can be found in the **ECT\_16B8C Block User Guide**. ECT stands for Enhanced Capture Timer.
- When you reset the MC9S12, the clock to the timer subsystem is initially turned off to save power.
  - To turn on the clock you need to write a 1 to Bit 7 of register TSCR1 (Timer System Control Register 1) at address 0x0046.
- The clock starts at 0x0000, counts up (0x0001, 0x0002, etc.) until it gets to 0xFFFF. It rolls over from 0xFFFF to 0x0000, and continues counting forever (until you turn the counter off or reset the MC9S12).
- It takes 2.7307 ms (65,536 counts/24,000,000 counts/sec) for the counter to count from 0x0000 to 0xFFFF and roll over to 0x0000.
- To determine the time an event happens, you can read the value of the clock (by reading the 16-bit TCNT (Timer Count Register) at address 0x0044.

ECT\_16B8C Block User Guide V01.03

## 1.4 Block Diagram

14

Timer inside the MC9S12: When you enable timer (by writing a 1 to bit 7 of TSCR), you connect an 24-MHz oscillator to a 16-bit counter. You can read the counter at address TCNT. The counter will start at 0, will count to 0xFFFF, then roll over to 0x0000. It will take 2.7307 ms for this to happen.

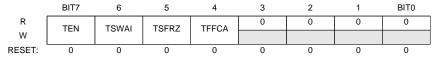

To enable timer on HC12, set Bit 7 of register TCSR:

bset TSCR1, #\$80 TSCR1 = TSCR1 | 0x80;

ECT\_16B8C Block User Guide V01.03

## 3.3.6 TSCR1 — Timer System Control Register 1

= Unimplemented or Reserved

Read or write anytime.

- TEN Timer Enable
  - 0 = Disables the main timer, including the counter. Can be used for reducing power consumption. 1 = Allows the timer to function normally.

If for any reason the timer is not active, there is no  $\div 64$  clock for the pulse accumulator since the  $\div 64$  is generated by the timer prescaler.

TSWAI - Timer Module Stops While in Wait

- 0 = Allows the timer module to continue running during wait.
  - 1 = Disables the timer module when the MCU is in the wait mode. Timer interrupts cannot be used to get the MCU out of wait.

TSWAI also affects pulse accumulators and modulus down counters.

TSFRZ — Timer and Modulus Counter Stop While in Freeze Mode

- 0 = Allows the timer and modulus counter to continue running while in freeze mode.
- 1 = Disables the timer and modulus counter whenever the MCU is in freeze mode. This is useful for emulation.

TSFRZ does not stop the pulse accumulator.

TFFCA — Timer Fast Flag Clear All

- 0 = Allows the timer flag clearing to function normally.
- I = For TFLG1(\$0E), a read from an input capture or a write to the output compare channel (\$10-\$1F) causes the corresponding channel flag, CnF, to be cleared. For TFLG2 (\$0F), any access to the TCNT register (\$04, \$05) clears the TOF flag. Any access to the PACN3 and PACN2 registers (\$22, \$23) clears the PAOVF and PAIF flags in the PAFLG register (\$21). Any access to the PACN1 and PACN0 registers (\$24, \$25) clears the PBOVF flag in the PBFLG register (\$31). This has the advantage of eliminating software overhead in a separate clear sequence. Extra care is required to avoid accidental flag clearing due to unintended accesses.

22

🕅 MOTOROLA

## Block User Guide — S12ECT16B8CV1/D V01.03

## 3.3.4 OC7D — Output Compare 7 Data Register

Register of	ffset: \$_03							
	BIT7	6	5	4	3	2	1	BIT0
R W	OC7D7	OC7D6	OC7D5	OC7D4	OC7D3	OC7D2	OC7D1	OC7D0
RESET:	0	0	0	0	0	0	0	0

## Figure 3-4 Output Compare 7 Data Register (OC7D)

Read or write anytime.

A channel 7 output compare can cause bits in the output compare 7 data register to transfer to the timer port data register depending on the output compare 7 mask register.

## 3.3.5 TCNT — Timer Count Register

Register offset: \$\_04-\$\_05

	BIT15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	BIT0
R	tcnt	tcnt	tcnt	tcnt	tcnt	tcnt	tcnt	tcnt	tcnt	tcnt	tcnt	tcnt	tcnt	tcnt	tcnt	tcnt
W	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESET:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## Figure 3-5 Timer Count Register (TCNT)

The 16-bit main timer is an up counter.

A full access for the counter register should take place in one clock cycle. A separate read/write for high byte and low byte will give a different result than accessing them as a word.

Read anytime.

Write has no meaning or effect in the normal mode; only writable in special modes (test\_mode = 1).

The period of the first count after a write to the TCNT registers may be a different size because the write is not synchronized with the prescaler clock.

(A) MOTOROLA

- To put in a delay of 2.7307 ms, you could wait from one reading of 0x0000 to the next reading of 0x0000.
- **Problem**: You cannot read the TCNT register quickly enough to make sure you will see the 0x0000.

```
To put in a delay for 2.7307 ms, could watch timer until

TCNT == 0x0000:

bset TSCR1,#$80 TSCR1 = TSCR1 | 0x80;

11: ldd TCNT while (TCNT != 0x0000);

bne 11

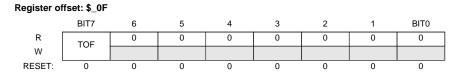

Problem: You might see 0xFFFF and 0x0001, and miss 0x0000
```

- Solution: The MC9S12 has built-in hardware with will set a flip-flop every time the counter rolls over from 0xFFFF to 0x0000.
- To wait for 2.7307 ms, just wait until the flip-flop is set, then clear the flip-flop, and wait until the next time the flip-flop is set.
- You can find the state of the flip-flop by looking at bit 7 (the Timer Overflow Flag (TOF) bit) of the Timer Flag Register 2 (TFLG2) register at address 0x004F.
- You can clear the flip-flop by writing a 1 to the TOF bit of TFLG2.

Solution:	When timer ove	erflows, latch a	a 1 into a flip-flq	p.			
Now when	timer overflows	(goes from 0xF)	FFF to 0x0000),				
Bit 7 of	TFLG2 register i	s set to one.	Can clear				
register	by writting a 1	to Bit 7 of TFI	LG register.	TIMER	OVERFLOW IN	ITERRUPT

			TOF Write <sup>—</sup> (Bit 7 of	TFLG2, addr 0x4F)			
bset 11: brclr ldaa staa	TSCR1, #\$80 TFIC2, #\$80, 11 #\$80 TFCL2		Bit 7 of TFLG2 is se	t		(2 & 0x80) = 0);	//Enable timer // Wait for TOF // Clear TOF

## Block User Guide — S12ECT16B8CV1/D V01.03

## 3.3.13 TFLG2 — Main Timer Interrupt Flag 2

= Unimplemented or Reserved

Figure 3-13 Main Timer Interrupt Flag 2 (TFLG2)

TFLG2 indicates when interrupt conditions have occurred. To clear a bit in the flag register, write the bit to one.

Read anytime. Write used in clearing mechanism (set bits cause corresponding bits to be cleared).

Any access to TCNT will clear TFLG2 register if the TFFCA bit in TSCR register is set.

TOF — Timer Overflow Flag

Set when 16-bit free-running timer overflows from \$FFFF to \$0000. This bit is cleared automatically by a write to the TFLG2 register with bit 7 set. (See also TCRE control bit explanation.)

- Another problem: Sometimes you may want to delay longer than 2.7307 ms, or time an event which takes longer than 2.7307 ms. This is hard to do if the counter rolls over every 2.7307 ms.
- Solution: The MC9S12 allows you to slow down the clock which drives the counter.
- You can slow down the clock by dividing the 24 MHz clock by 2, 4, 8, 16, 32, 64 or 128.
- You do this by writing to the prescaler bits (PR2:0) of the Timer System Control Register 2 (TSCR2) Register at address 0x004D.

2.7307 ms will be to	o short if you want to see lights	flash.	
You can slow down cl	ock by dividing it before you sen	d it to	
the 16-bit counter.	By setting prescaler bits PR2, PF	1,PR0 of TSCR2 you can	
slow down the clock:			
PR2:0 Divide Freq	Overflow Rate		
000 1 24 001 2 12 010 4 6 011 8 3 100 16 1.5 101 32 0.75 110 64 0.375 111 128 0.1875 To set up timer so in best TSCR1,#\$80 1daa #\$05 staa TSCR2		TIMER OVERFLOW IN	ITERRUPT
		vcc

24 MHz TEN	Prescaler TCNT (addr 0x44		
(Bit 7 of TSCR1, addr 0x46)	PR[20]		
		OF Vrite	
		Bit 7 of TFLG2, addr 0x4F)	

## Block User Guide — S12ECT16B8CV1/D V01.03

#### Register offset: \$\_0C BIT7 6 5 4 3 2 1 BIT0 R C7I C6I C5I C4I C3I C2I C1I COI w RESET: 0 0 0 0 0 0 0 0

## Figure 3-10 Timer Interrupt Enable Register (TIE)

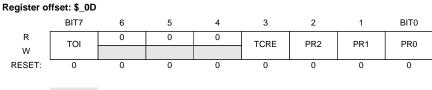

Read or write anytime.

The bits in TIE correspond bit-for-bit with the bits in the TFLG1 status register. If cleared, the corresponding flag is disabled from causing a hardware interrupt. If set, the corresponding flag is enabled to cause a interrupt.

C7I-C0I — Input Capture/Output Compare "x" Interrupt Enable

3.3.10 TIE — Timer Interrupt Enable Register

## 3.3.11 TSCR2 — Timer System Control Register 2

Read or write anytime.

TOI — Timer Overflow Interrupt Enable

0 = Interrupt inhibited

1 = Hardware interrupt requested when TOF flag set

TCRE — Timer Counter Reset Enable

This bit allows the timer counter to be reset by a successful output compare 7 event. This mode of operation is similar to an up-counting modulus counter.

0 = Counter reset inhibited and counter free runs

1 = Counter reset by a successful output compare 7

If TC7 = \$0000 and TCRE = 1, TCNT will stay at \$0000 continuously. If TC7 = \$FFFF and TCRE = 1, TOF will never be set when TCNT is reset from \$FFFF to \$0000.

PR2, PR1, PR0 - Timer Prescaler Select

## ECT\_16B8C Block User Guide V01.03

These three bits specify the number of  $\pm 2$  stages that are to be inserted between the bus clock and the main timer counter.

PR2	PR1	PR0	Prescale Factor		
0	0	0	1		
0	0	1	2		
0	1	0	4		
0	1	1	8		
1	0	0	16		
1	0	1	32		
1	1	0	64		
1	1	1	128		

The newly selected prescale factor will not take effect until the next synchronized edge where all prescale counter stages equal zero.

## 3.3.12 TFLG1 — Main Timer Interrupt Flag 1

#### Register offset: \$\_0E

	BIT7	6	5	4	3	2	1	BIT0
R W	C7F	C6F	C5F	C4F	C3F	C2F	C1F	C0F
RESET:	0	0	0	0	0	0	0	0

## Figure 3-12 Main Timer Interrupt Flag 1 (TFLG1)

TFLG1 indicates when interrupt conditions have occurred. To clear a bit in the flag register, write a one to the bit.

Use of the TFMOD bit in the ICSYS register (\$2B) in conjunction with the use of the ICOVW register (\$2A) allows a timer interrupt to be generated after capturing two values in the capture and holding registers instead of generating an interrupt for every capture.

Read anytime. Write used in the clearing mechanism (set bits cause corresponding bits to be cleared). Writing a zero will not affect current status of the bit.

When TFFCA bit in TSCR register is set, a read from an input capture or a write into an output compare channel (\$10–\$1F) will cause the corresponding channel flag CnF to be cleared.

C7F-C0F — Input Capture/Output Compare Channel "n" Flag.

COF can also be set by 16 - bit Pulse Accumulator B (PACB). C3F - C0F can also be set by 8 - bit pulse accumulators PAC3 - PAC0.

🕅 MOTOROLA

# Setting and Clearing Bits in C

• To put a specific number into a memory location or register (e.g., to put 0x55 into PORTA):

movb #\$55,PORTA PORTA = 0x55;

• To set a particular bit of a register (e.g., set Bit 4 of PORTA) while leaving the other bits unchanged do a bitwise OR of the register and a mask which has a 1 in the bit(s) you want to set, and a 0 in the other bits:

bset PORTA,#\$10 PORTA = PORTA | 0x10;

• To clear a particular bit of a register (e.g., clear Bit 5 of PORTA) while leaving the other bits unchanged do a bitwise AND of the register and a mask which has a 0 in the bit(s) you want to clear, and a 1 in the other bits. You can construct this mask by complementing a mask which has a 1 in the bit(s) you want to set, and a 0 in the other bits:

bclr PORTA,#\$20 PORTA = PORTA & OxDF; PORTA = PORTA & ~0x20;

Using  $^{\circ}0x20$  is probably better than using 0xDF because it is less likely that you will make a mistake when complementing 0x20 in your head.

• To change several bits of a register, AND the register with 1's in the bits you want to leave unchanged, then OR the result with 1's in the bits you want to set, and 0's in the bits you want to clear. For example, To set bits 2 and 0, and clear bit 1 (write 101 to bits 2-0) of TSCR2, do the following:

bclr	TSCR2,#\$02	TSCR2 =	(TSCR2	& ~0x02)	0x05;
bset	TSCR2,#05;				

• Write to all bits of a register when you know what all bits should be, such as when you initialize it. Set or clear bits when you want to change only one or a few bits and leave the others unchanged.

```
C Program to implement a delay
```

```
#include <hidef.h>
#include "derivative.h"
void delay(void);
main()
{
                              /* Enable timer subsystem */
    TSCR1 = TSCR1 | 0x80;
                              /* Set overflow time to 87 ms */
    TSCR2 = 0x05;
    TFLAG2 = 0x80;
                              /* Make sure TOF bit clear */
    while (1) {
        PORTB = PORTB + 1;
        delay();
    }
}
void delay(void)
{
    while ((TFLAG2 & 0x80) == 0x00) ; /* Wait for timer overflow */
    TFLAG2 = 0x80;
                                       /* Clear TOF bit */
}
```

- Problem: Cannot do anything while waiting
- Solution: Interrupt can do other things, and hardware will signal processor when overflow occurs
- Need to understand how processor handles exceptions resets and interrupts
- Start by looking at what happens when the MC9S12 is reset

# What Happens When You Reset the MC9S12?

- What happens to the MC9S12 when you turn on power or push the reset button?
- How does the MC9S12 know which instruction to execute first?
- $\bullet$  On reset the MC9S12 loads the PC with the address located at address 0xFFFE and <code>0xFFFF</code>.
- Here is what is in the memory of our MC9S12:

	0	1	2	3	4	5	6	7	8	9	Α	В	С	D	E	F
FFFO	F6	EC	F6	FO	F6	F4	F6	F8	F6	FC	F7	00	F7	04	FO	00

• On reset or power-up, the first instruction your MC9S12 will execute is the one located at address 0xF000.

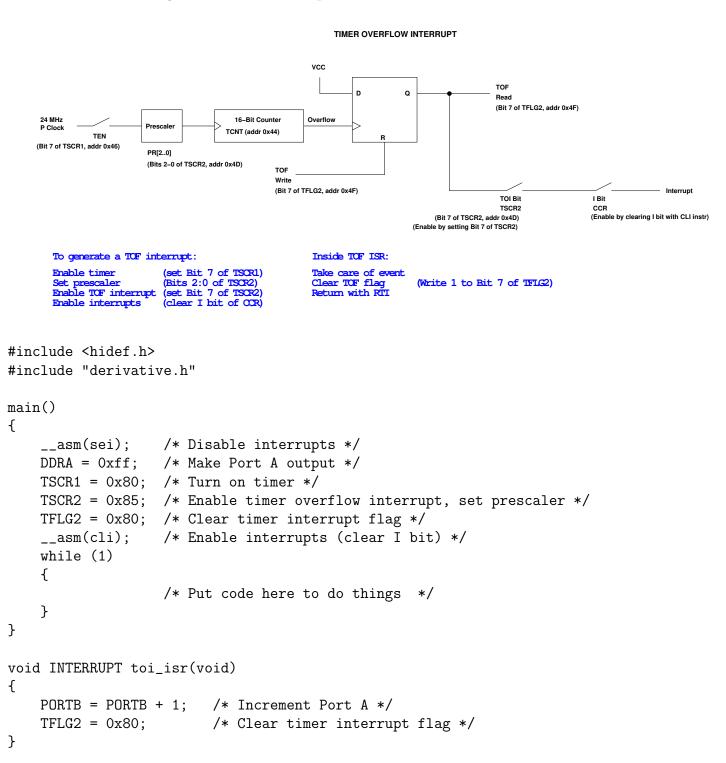

## Introduction to Interrupts

Can implement a delay by waiting for the TOF flag to become set:

```
void delay(void)
{
    while ((TFLG2 & 0x80) == 0) ;
    TFLG2 = 0x80;
}
```

Problem: Can't do anything else while waiting. Wastes resources of MC9S12.

- Solution: Use an interrupt to tell you when the timer overflow has occurred.
- **Interrupt:** Allow the MC9S12 to do other things while waiting for an event to happen. When the event happens, tell MC9S12 to take care of event, then go back to what it was doing.
- What happens when MC9S12 gets an interrupt: MC9S12 automatically jumps to part of the program which tells it what to do when it receives the interrupt (Interrupt Service Routine).
- How does MC9S12 know where the ISR is located: A set of memory locations called Interrupt Vectors tell the MC9S12 the address of the ISR for each type of interrupt.
- How does MC9S12 know where to return to: Return address pushed onto stack before MC9S12 jumps to ISR. You use the RTI (Return from Interrupt) instruction to pull the return address off of the stack when you exit the ISR.
- What happens if ISR changes registers: All registers are pushed onto stack before jumping to ISR, and pulled off the stack before returning to program. When you execute the RTI instruction at the end of the ISR, the registers are pulled off of the stack.
- What happens if you get an interrupt while in an ISR: MC9S12 disables interrupts (sets I bit of CCR) before it starts executing ISR.
- To Return from the ISR You must return from the ISR using the RTI instruction. The RTI instruction tells the MC9S12 to pull all the registers off of the stack and return to the address where it was processing when the interrupt occurred.

## How to generate an interrupt when the timer overflows
