

Analog/Digital Converters

- A 10-bit A/D converter is used to convert an input voltage. The reference voltages are $V_{RL} = 0\text{V}$ and $V_{RH} = 5\text{V}$.

- What is the quantization level of the A/D converter?

$$\Delta V = \frac{V_{RH} - V_{RL}}{2^b - 1} = 4.88 \text{ mV}$$

- What is the dynamic range of the A/D converter?

$$\text{DR}_{\text{dB}} = 6.02b = 60.2 \text{ dB}$$

- If the value read from the A/D converter is 0x15a, what is the input voltage?

$$V_{in} = V_{RL} + \frac{V_{RH} - V_{RL}}{2^b - 1} \text{ADvalue} = 0 \text{ V} + 4.88 \text{ mV} \times 346 = 1.6894 \text{ V}$$

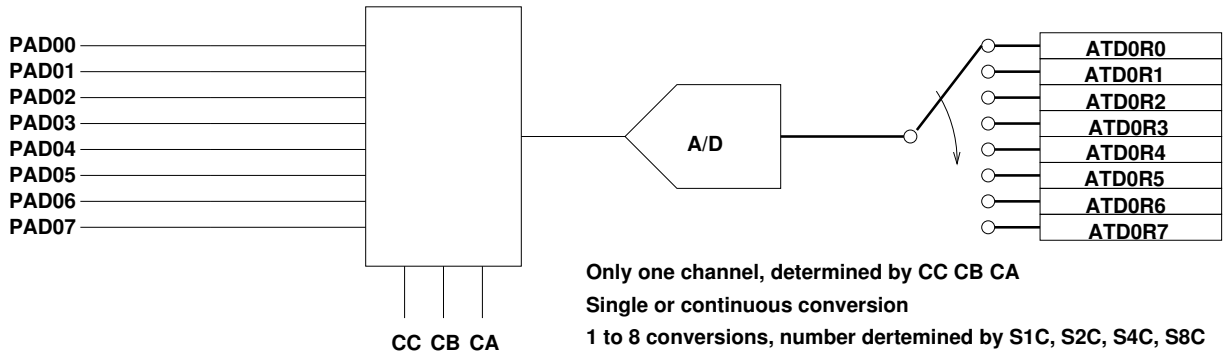

- The MC9S12 has two 10-bit A/D converter (ATD0 and ATD1).
 - Each A/D converter has an 8-channel analog multiplexer in front of it, so each channel can convert 8 analog inputs (but not at exactly the same time).
- ATD0 uses the eight bits of Port AD0, called PAD00 through PAD07
 - Ports AD0 and AD1 of ATD0 are used by DBug-12 at startup to determine whether to execute DBug-12, or to run code from EEPROM of the bootloader.
- ATD1 uses the eight bits of Port AD1, called PAD08 through PAD15

The MC9S12 Analog/Digital Converter

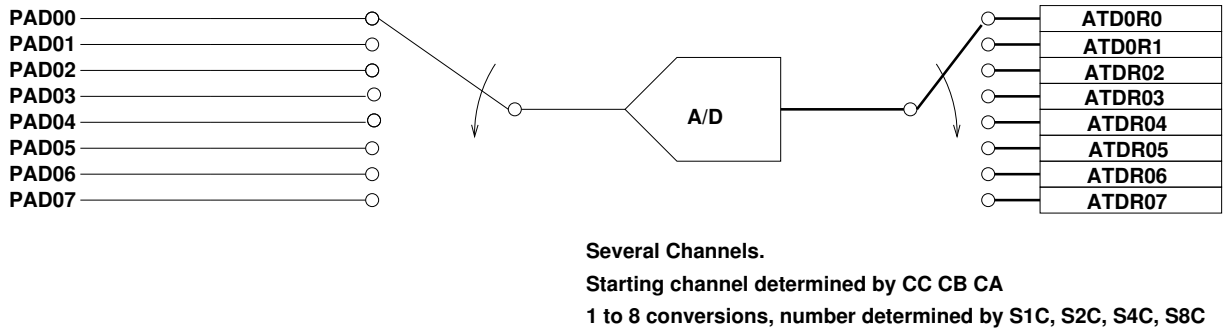

- We will discuss only ATD0. ATD1 is identical.
- ATD0 is an eight-channel 10-bit A/D converter.
 - The A/D converter can also be used in 8-bit mode.
- There are eight inputs to the A/D converter.
- The inputs are fed through a multiplexer to the single A/D converter.
- There are inputs on the MC9S12 for the reference voltages V_{RL} and V_{RH}
 - In normal operation $V_{RL} = 0$ V and $V_{RH} = 5$ V.
 - You must have $V_{SS} \leq V_{RL} < V_{RH} \leq V_{DD}$.
 - The accuracy of the A/D converter is guaranteed only for $V_{RH} - V_{RL} = 5$ V.
- When using the A/D converter, you can choose between performing **single** or **continuous conversion** on a **single channel** or **multiple channels**.
- The AD conversion results are stored in the registers ATD0DR0 through ATD0DR7
 - You can choose whether to have the results left-justified or right-justified.
- To program the MC9S12 A/D converter you need to set up the A/D control registers ATD0CTL2, ATD0CTL3, ATD0CTL4 and ATD0CTL5
- The registers ATD0CTL0 and ATD0CTL1 are used for factory test, and not used in normal operation.
- When the AD converter is not used, Port AD0 can be used for general purpose input
 - Register ATD0DIEN is used to set up Port AD0 pins for use as a general purpose inputs.
 - The values on the pins are read from PORTAD0.

HCS12 A/D Converter Setup

MULT = 0

MULT = 1

ATD0CTL2	ADPU	AFFC	ASWAI	ETRIGLE	ETRIGLP	0	ASCIE	ASCIF	0x0082
ATD0CTL3	0	S8C	S4C	S2C	S1C	FIFO	FRZ1	FRZ0	0x0083
ATD0CTL4	SRES8	SMP1	SMP0	PRS4	PRS3	PRS2	PRS1	PRS0	0x0084
ATD0CTL5	DJM	DSGN	SCAN	MULT	0	CC	CB	CA	0x0085
ATD0STAT0	SCF	0	ETORF	FIFOR	0	CC2	CC1	CC0	0x0086
ATD0STAT1	CCF7	CCF6	CCF5	CCF4	CCF3	CCF2	CCF1	CCF0	0x008B

To Use A/D Converter:

ADPU = 1 (Power up A/D)

SCAN = 0 => Single conversion sequence

SCAN = 1 => Convert continuously

**S8C, S4C, S2C, S1C: Number of conversions per sequency: 0001 -- 0111 (1 to 7)
0000 or 1xxx (8)**

SRES8 = 0 => 10 Bit Mode

SRES8 = 1 => 8 Bit Mode

DJM = 0 => Left justified data in the result registers

DJM = 1 => Right justified data in the result registers

DSGN = 0 => Unsigned data in the result registers

DSGN = 1 => Signed data representation in the result registers (only for left justified)

ATDCTL4 = 0x85 => 2 MHz AD clock, 12 cycles per conversion, 8 bit mode

ATDCTL4 = 0x05 => 2 MHz AD clock, 14 cycles per conversion, 10 bit mode

Other values of ATDCTL4 will not work, or will result in slower operation of A/D

SCF Flag is set after a sequence of conversions is complete

The SCF Flag is cleared when ATD0CTL5 is written, or by writing a 1 to the SCF bit

After writing to ATD0CTL5, SCF flag cleared and conversions start

USING THE MC9S12 A/D CONVERTER

1. Power up A/D Converter (ADPU = 1 in ATDOCTL2)
2. Select number of conversions per sequence (S8C S4C S2C S1C in ATDOCTL3)
 - S8C S4C S2C S1C = 0001 to 0111 for 1 to 7 conversions
 - S8C S4C S2C S1C = 0000 or 1xxx for 8 conversions
3. Set up ATDOCTL4
 - For 8-bit mode write 0x85 to ATDOCTL4
 - For 10-bit mode write 0x05 to ATDOCTL4
 - Other values of ATDOCTL4 either will not work or will result in slower A/D conversion rates
4. Select DJM in ATDOCTL5
 - (a) DJM = 0 => Left justified data in the result registers
 - (b) DJM = 1 => Right justified data in the result registers
5. Select DSGN in ATDOCTL5
 - (a) DSGN = 0 => Unsigned data representation in the result register
 - (b) DSGN = 1 => Signed data representation in the result register

The Available Result Data Formats are shown in the following table:

SRES8	DJM	DSGN	Result Data Format
1	0	0	8-bit/left justified/unsigned - Bits 15-8
1	0	1	8-bit/left justified/signed - Bits 15-8
1	1	X	8-bit/right justified/unsigned - Bits 7-0
0	0	0	10-bit/left justified/unsigned - Bits 15-6
0	0	1	10-bit/left justified/signed - Bits 15-6
0	1	X	10-bit/right justified/unsigned - Bits 9-0

6. Select **MULT** in **ATDOCTL5**:

- **MULT** = 0: Convert one channel eight the specified number of times
 - Choose channel to convert with **CC**, **CB**, **CA** of **ATDOCTL5**.
- **MULT** = 1: Convert across several channels. **CC**, **CB**, **CA** of **ATDOCTL5** is the first channel to be converted

7. Select **SCAN** in **ATDOCTL5**:

- **SCAN** = 0: Convert one sequence, then stop
- **SCAN** = 1: Convert continuously

8. After writing to **ATDOCTL5**, the A/D converter starts, and the **SCF** bit is cleared. After a sequence of conversions is completed, the **SCF** flag in **ATDOSTAT0** is set.

- You can read the results in **ATDODRx** [0-7]H.

9. If **SCAN** = 0, you need to write to **ATDOCTL5** to start a new sequence. If **SCAN** = 1, the conversions continue automatically, and you can read new values in **ADR**[0-7]H.10. To get an interrupt after the sequence of conversions are completed, set **ASCIE** bit of **ATDOCTL2**. After the sequence of conversions, the **ASCIF** bit in **ATDOCTL2** will be set, and an interrupt will be generated.11. With 24 MHz bus clock and **ATDOCTL4** = 0x05, it takes 7 μ s to make one conversion, 56 μ s to make eight conversions.

12. On MC9S12 EVBU, AD0 channels 0 and 1 are used to determine start-up program (D-Bug12, EEPROM or bootloader). Do not use AD0 channels 0 or 1 unless absolutely necessary (you need more than 14 A/D channels).

13.

$$\text{ATDODRx} = \frac{V_{in} - V_{RL}}{V_{RH} - V_{RL}} \times 1024$$

Normally, $V_{RL} = 0$ V, and $V_{RH} = 5$ V, so

$$\text{ATDODRx} = \frac{V_{in}}{5 \text{ V}} \times 1024$$

Example: $\text{ATDODR0} = 448 \Rightarrow V_{in} = 2.19$ V

14. To use 10-bit result, set **ATDOCTL4** = 0x05 (Gives 2 MHz AD clock with 24 MHz bus clock, 10-bit mode)15. You can get more accuracy by averaging multiple conversions. If you need only one channel, set **MULT** = 0, set **SC** bits for eight conversions, then average all eight result registers. The following assumes the data was right justified:

```
int avg;

avg = (ATDODR0 + ATDODR1
      ATDODR2 + ATDODR3
      ATDODR4 + ATDODR5
      ATDODR6 + ATDODR7) >> 3;
```

```

/* Read temperature from PAD4. Turn on heater if temp too low,
 * turn off heater if temp too high. Heater connected to Bit 0
 * of Port A.
 */
#include "hcs12.h"
