Summary of MC9S12 addressing modes

ADDRESSING MODES

Name	Example	Op Code	Effective Address
INH Inherent	ABA	18 06	None
IMM Immediate	LDAA #$35	86 35	PC + 1
DIR Direct	LDAA $35	96 35	0x0035
EXT Extended	LDAA $2035	B6 20 35	0x0935

IDX Indexed
IDX1
IDX2
	LDAA 3,X
	LDAA 30,X
	LDAA 300,X
		A6 03
		A6 E0 13
		A6 E2 01 2C
			X + 3
			X + 30
			X + 300

IDX Indexed Postincrement	LDAA 3,X+	A6 32	X (X+3 -> X)
IDX Indexed Preincrement	LDAA 3,+X	A6 22	X+3 (X+3 -> X)
IDX Indexed Postdecrement	LDAA 3,X-	A6 3D	X (X-3 -> X)
IDX Indexed Predecrement	LDAA 3,-X	A6 2D	X-3 (X-3 -> X)
REL Relative	BRA $1050 LBRA $1F00	20 23 18 20 0E CF	PC + 2 + Offset PC + 4 + Offset

A few instructions have **two** effective addresses:

- `MOVB #$AA,$1C00` Move byte `0xAA` (IMM) to address `$1C00` (EXT)
- `MOVW 0,X,0,Y` Move word from address pointed to by `X` (IDX) to address pointed to by `Y` (IDX)

A few instructions have **three** effective addresses:

- `BRSET FOO,#$03,LABEL` Branch to `LABEL` (REL) if bits `#$03` (IMM) of variable `FOO` (EXT) are set.

Using X and Y as Pointers

- Registers `X` and `Y` are often used to point to data.
- To initialize pointer use

```
ldx     #table
```

not

```
ldx     table
```

- For example, the following loads the address of `table` (`$1000`) into `X`; i.e., `X` will point to `table`:

```
ldx     #table    ;  Address of table => X
```

The following puts the first two bytes of `table` (`$0C7A`) into `X`. `X` will **not** point to `table`:

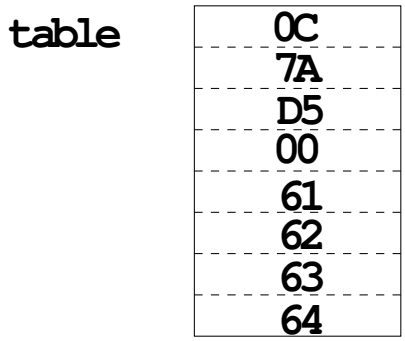
```
ldx     table     ;  First two bytes of table => X
```

- To step through table, need to increment pointer after use

```
ldaa    0,x
inx
```

or

```
ldaa    1,x+
```



```
        org   $900
table:  dc.b  12,122,-43,0
        dc.b  'a','b','c','d'
```

Which branch instruction should you use?

Branch if A > B

Is 0xFF > 0x00?

If unsigned, 0xFF = 255 and 0x00 = 0,

so 0xFF > 0x00

If signed, 0xFF = −1 and 0x00 = 0,

so 0xFF < 0x00

Using unsigned numbers: BHI (checks C bit of CCR)

Using signed numbers: BGT (checks V bit of CCR)

For unsigned numbers, use branch instructions which check C bit

For signed numbers, use branch instructions which check V bit

Hand Assembling a Program

To hand-assemble a program, do the following:

1. Start with the `org` statement, which shows where the first byte of the program will go into memory.
   (E.g., `org $2000` will put the first instruction at address `$2000`.)
2. Look at the first instruction. Determine the addressing mode used.
   (E.g., `ldab #10` uses `IMM` mode.)
3. Look up the instruction in the **MC9S12 S12CPUV2 Reference Manual**, find the appropriate Addressing Mode, and the Object Code for that addressing mode.
   (E.g., `ldab IMM` has object code `C6 ii`.)
   - Table A-1 of the **S12CPUV2 Reference Manual** has a concise summary of the instructions,addressing modes, op-codes, and cycles.
4. Put in the object code for the instruction, and put in the appropriate operand. Be careful to convert decimal operands to hex operands if necessary.
   (E.g., `ldab #10` becomes `C6 0A`.)
5. Add the number of bytes of this instruction to the address of the instruction to determine the address of the next instruction.
   (E.g., `$2000 + 2 = $2002` will be the starting addrss of the next instruction.)

```
        org    $2000
        ldab   #10
loop:   clra
        dbne   b,loop
        swi
```

Table A-1. Instruction Set Summary (Sheet 7 of 14)

DBNE Decrement and Branch if Not Equal to Zero DBNE

Operation

(counter) – 1 ⇒ counter
If (counter) not = 0, then (PC) + $0003 + rel ⇒ PC

Subtracts one from the counter register A, B, D, X, Y, or SP. Branches to a relative destination if the counter register does not reach zero. Rel is a 9-bit two's complement offset for branching forward or backward in memory. Branching range is $100 to $0FF (–256 to +255) from the address following the last byte of object code in the instruction.

NOTES:
1. Bits 7:6:5 select DBEQ or DBNE; bit 4 is the offset sign bit: bit 3 is not used; bits 2:1:0 select the counter register.

MC9S12 Cycles

- MC9S12 on the Dragon12-Plus board works on 48 MHz clock
- A processor cycle takes 2 clock cycles – P clock is 24 MHz
- Each processor cycle takes 41.7 ns (1/24 μs) to execute
- An instruction takes from 1 to 12 processor cycles to execute
- You can determine how many cycles an instruction takes by looking up the CPU cycles for that instruction in the S12CPUV2 Reference Manual.
  - For example, `LDAA` using the `IMM` addressing mode shows one CPU cycle (of type P).
  - `LDAA` using the `EXT` addressing mode shows three CPU cycles (of type rPO).
  - Section 6.6 of the S12CPUV2 Reference Manual explains what the MC9S12 is doing during each of the different types of CPU cycles.

```
000                    org  $2000     ; Inst   Mode   Cycles
2000 C6 0A              ldab #10       ; LDAB   (IMM)    1
2002 87         loop:   clra           ; CLRA   (INH)    1
2003 04 31 FC           dbne b,loop    ; DBNE   (REL)    3
2006 3F                 swi            ; SWI             9
```

The program executes the `ldab #10` instruction once (which takes one cycle). It then goes through loop 10 times (which has two instructions, on with one cycle and one with three cycles), and finishes with the `swi` instruction (which takes 9 cycles).

Total number of cycles:

$1 + 10 \times (1 + 3) + 9 = 50$

50 cycles = 50 $\times$ 41.7 ns/cycle = 2.08 μs

LDAB Load B LDAB

Operation

(M) ⇒ B
or
imm ⇒ B

Loads B with either the value in M or an immediate value.

CCR Effects

HC12 Assembly Language Programming

Programming Model

Addressing Modes

Assembler Directives

HC12 Instructions

Flow Charts

Assembler Directives

- In order to write an assembly language program it is necessary to use *assembler directives*.
- These are not instructions which the MC9S12 executes but are directives to the assembler program about such things as where to put code and data into memory.
- CodeWarrior has a large number of assembler directives, which can be found in the CodeWarrior help section.
- We will use only a few of these directives. (Note: In the following table, [] means an optional argument.) Here are the ones we will need:

Directive Name	Description	Example
equ	Give a value to a symbol	`len:  equ  100`
org	Set starting value of location counter where code or data will go	`org  $1000`
dc.b	Allocate and initialize storage for 8-bit variables. Place the bytes in successive memory locations	`var:  dc.b  2,18` `name:  dc.b  "Jane Doe"`
dc.w	Allocate and initialize storage for 16-bit variables. Place the bytes in successive memory locations	`var:  dc.w  $ABCD`
ds.b	Allocate specified number of 8-bit storage spaces.	`table: ds.w  10`
ds.w	Allocate specified number of 16-bit storage spaces.	`table2: ds.w  50`
dcb.b	Fill memory with a given value The first value is the number of bytes to fill. The second number is the value to put into memory	`init_data: dcb.b  100,0`

Using labels in assembly programs

A **label** is defined by a name followed by a colon as the first thing on a line. When the label is referred to in the program, it has the numerical value of the location counter when the label was defined.

Here is a code fragment using labels and the assembler directives `dc` and `ds`:

```
         org     $2000
table1:  dc.b    $23,$17,$f2,$a3,$56
table2:  ds.b    5
var:     dc.w    $43af
```

The CodeWarrior assembler produces a listing file (`.lst`). Here is the listing file from the assembler:

```
Freescale HC12-Assembler
(c) Copyright Freescale 1987-2009

 Abs. Rel.   Loc    Obj. code   Source line
 ---- ----   ------ ---------   -----------
    1    1                              org     $2000
    2    2  a002000 2317 F2A3   table1:  dc.b    $23,$17,$f2,$a3,$56
               002004 56
    3    3  a002005              table2:  ds.b    5
    4    4  a00200A 43AF         var:     dc.w    $43af
    5    5
```

Note that `table1` is a name with the value of `$2000`, the value of the location counter defined in the `org` directive. Five bytes of data are defined by the `dc.b` directive, so the location counter is increased from `$2000` to `$2005`. `table2` is a name with the value of `$2005`. Five bytes of data are set aside for `table2` by the `ds.b 5` directive. The as12 assembler initialized these five bytes of data to all zeros. `var` is a name with the value of `$200a`, the first location after `table2`.

HC12 Assembly Language Programming

Programming Model

Addressing Modes

Assembler Directives

HC12 Instructions

Flow Charts

1. Data Transfer and Manipulation Instructions — instructions which move and manipulate data (**S12CPUV2 Reference Manual**, Sections 5.3, 5.4, and 5.5).

   - Load and Store — load copy of memory contents into a register; store copy of register contents into memory.

     ```
     LDAA  $2000  ; Copy contents of addr $2000 into A
     STD   0,X    ; Copy contents of D to addrs X and X+1
     ```

   - Transfer — copy contents of one register to another.

     ```
     TBA                  ; Copy B to A
     TFR  X,Y             ; Copy X to Y
     ```

   - Exhange — exchange contents of two registers.

     ```
     XGDX                  ; Exchange contents of D and X
     EXG A,B               ; Exchange contents of A and B
     ```

   - Move — copy contents of one memory location to another.

     ```
     MOVB $2000,$20A0    ; Copy byte at $2000 to $20A0
     MOVW 2,X+,2,Y+     ; Copy two bytes from address held
                         ; in X to address held in Y
                         ; Add 2 to X and Y
     ```

2. Arithmetic Instructions — addition, subtraction, multiplication, divison (**S12CPUV2 Reference Manual**, Sections 5.6, 5.8 and 5.12).

   ```
   ABA          ; Add B to A; results in A
   SUBD $20A1   ; Subtract contents of $20A1 from D
   INX          ; Increment X by 1
   MUL          ; Multiply A by B; results in D
   ```

3. Logic and Bit Instructions — perform logical operations (**S12CPUV2 Reference Manual**, Sections 5.9, 5.10, 5.11, 5.13 and 5.14).

   - Logic Instructions

     ```
     ANDA $2000 ; Logical AND of A with contents of $2000
     EORB 2,X   ; Exclusive OR B with contents of address (X+2)
     ```

   - Clear, Complement and Negate Instructions

     ```
     NEG  -2,X  ; Negate (2's comp) contents of address (X-2)
     CLRA       ; Clear Acc A
     ```

- Bit manipulate and test instructions — work with one bit of a register or memory.

```
BITA #$08          ; Check to see if Bit 3 of A is set
BSET $0002,#$18    ; Set bits 3 and 4 of address $002
```

- Shift and rotate instructions

```
LSLA               ; Logical shift left A
ASR  $1000         ; Arithmetic shift right value at address $1000
```

4. Compare and test instructions — test contents of a register or memory (to see if zero, negative, etc.), or compare contents of a register to memory (to see if bigger than, etc.) (**S12CPUV2 Reference Manual**, Section 5.9).

```
TSTA          ; (A)-0 -- set flags accordingly
CPX  #$8000   ; (X) - $8000 -- set flags accordingly
```

5. Jump and Branch Instructions — Change flow of program (e.g., goto, it-then-else, switch-case) (**S12CPUV2 Reference Manual**, Sections 5.19, 5.20 and 5.21).

```
JMP  L1            ; Start executing code at address label L1
BEQ  L2            ; If Z bit set, go to label L2
DBNE X,L3          ; Decrement X; if X not 0 then goto L3
BRCLR $1A,#$80,L4 ; If bit 7 of addr $1A clear, go to label L4
JSR sub1           ; Jump to subroutine sub1
RTS                ; Return from subroutine
```

6. Interrupt Instructions — Initiate or terminate an interrupt call (**S12CPUV2 Reference Manual**, Section 5.22).

- Interrupt instructions

```
SWI        ; Initiate software interrupt
RTI        ; Return from interrupt
```

7. Index Manipulation Instructions — Put address into X, Y or SP, manipulate X, Y or SP (**S12CPUV2 Reference Manual**, Section 5.23).

```
ABX       ; Add (B) to (X)
LEAX 5,Y  ; Put address (Y) + 5 into X
```

8. Condition Code Instructions — change bits in Condition Code Register (**S12CPUV2 Reference Manual**, Section 5.26).

```
ANDCC #$f0  ; Clear N, Z, C and V bits of CCR
SEV         ; Set V bit of CCR
```

9. Stacking Instructions — push data onto and pull data off of stack (**S12CPUV2 Reference Manual**, Section 5.24).

```
PSHA      ; Push contents of A onto stack
PULX      ; Pull two top bytes of stack, put into X
```

10. Stop and Wait Instructions — put MC9S12 into low power mode (**S12CPUV2 Reference Manual**, Section 5.27).

```
STOP      ; Put into lowest power mode
WAI       ; Put into low power mode until next interrupt
```

11. Null Instructions

```
NOP       ; No operation
BRN       ; Branch never
```

12. Instructions we won't discuss or use — BCD arithmetic, fuzzy logic, minimum and maximum, multiply-accumulate, table interpolation (**S12CPUV2 Reference Manual**, Sections 5.7, 5.16, 5.17, and 5.18).

Disassembly of an MC9S12 Program

- It is sometimes useful to be able to convert MC9S12 op codes into mnemonics.
- For example, consider the hex code:

```
ADDR  DATA
---- -----------------------------------------------
1000  C6  05  CE  20  00  E6  01  18  06  04 35 EE 3F
```

- To determine the instructions, use Tables A.2 through A.7 of the S12CPUV2 Reference Manual.
  - If the first byte of the instruction is anything other than $18, use Sheet 1 of Table A.2 (Page 395). From this table, determine the number of bytes of the instruction and the addressing mode. For example, $C6 is a two-byte instruction, the mnemonic is `LDAB`, and it uses the `IMM` addressing mode. Thus, the two bytes `C6 05` is the op code for the instruction `LDAB #$05`.
  - If the first byte is $18, use Sheet 2 of Table A.2 (Page 396), and do the same thing. For example, `18 06` is a two byte instruction, the mnemonic is `ABA`, and it uses the `INH` addressing mode, so there is no operand. Thus, the two bytes `18 06` is the op code for the instruction `ABA`.
  - Indexed addressing mode is fairly complicated to disassemble. You need to use Table A.3 to determine the operand. For example, the op code `$E6` indicates `LDAB` indexed, and may use two to four bytes (one to three bytes in addition to the op code). The postbyte `01` indicates that the operand is `0,1`, which is 5-bit constant offest, which takes only one additional byte. All 5-bit constant offset, pre and post increment and decrement, and register offset instructions use one additional byte. All 9-bit constant offset instructions use two additional bytes, with the second byte holding 8 bits of the 9 bit offset. (The 9th bit is a direction bit, which is held in the first postbyte.) All 16-bit constant offset instructions use three postbytes, withe the 2nd and 3rd holding the 16-bit unsigned offset.
  - Transfer (`TFR`) and exchange (`EXG`) instructions all have the op code `$B7`. Use Table A.5 to determine whether it is `TFR` or an `EXG`, and to determine which registers are being used. If the most significant bit of the postbyte is 0, the instruction is a transfer instruction.
  - Loop instructions (*Decrement and Branch*, *Increment and Branch*, and *Test and Branch*) all have the op code `$04`. To determine which instruction the op code `$04` implies, and whether the branch is positive (forward) or negative (backward), use Table A.6. For example, in the sequence `04 35 EE`, the `04` indicates a loop instruction. The `35` indicates it is a `DBNE X` instruction (decrement register X and branch if result is not equal to zero), and the direction is backward (negative). The `EE` indicates a branch of `-18` bytes.
- Use up all the bytes for one instruction, then go on to the next instruction.

```
C6 05      => LDAA #$05       two-byte LDAA, IMM addressing mode
CE 20 00   => LDX  #$2000     three-byte LDX, IMM addressing mode
E6 01      => LDAB 1,X        two to four-byte LDAB, IDX addressing
                              mode.  Operand 01 => 1,X, a 5b constant
                              offset which uses only one postbyte
18 06      => ABA             two-byte ABA, INH addressing mode
04 35 EE   => DBNE X,(-18)    three-byte loop instruction
                              Postbyte 35 indicates DBNE X, negative
3F         => SWI             one-byte SWI, INH addressing mode
```

* The opcode $04 (on sheet 1 of 2) corresponds to one of the loop primitive instructions DBEQ, DBNE, IBEQ, IBNE, TBEQ, or TBNE.

† Refer to instruction summary for more information.

‡ Refer to instruction summary for different HC12 cycle count.

Page 2: When the CPU encounters a page 2 opcode ($18 on page 1 of the opcode map), it treats the next byte of object code as a page 2 instruction opcode.
